Quote & Proposal Builder

CPQ flow with tiered pricing rules, discount approval chains, and templated proposal generation handed off to e-signature.

`Next.js` `Prisma` `Stripe` `DocuSign`

VERSION	STATUS	LICENSE	RUNTIME	DATABASE	UPDATED
1.3.0	Open Source	MIT	Node 20	Postgres 16	Sep 2026

1. Overview

The Quote & Proposal Builder is a configure-price-quote flow for teams that have outgrown spreadsheets but do not want a full CPQ suite. A rep picks products and terms, the pricing engine applies tiered rules deterministically, any discount beyond the rep's authority routes through an approval chain, and the approved quote renders into a branded proposal that goes out for signature.

The design principle is that pricing must be reproducible. Rules are versioned and a quote pins the rule version it was priced under, so reopening a six-month-old quote shows the price it was actually offered at, not what today's rules would produce. Signature and billing are adapters at the edge — DocuSign and Stripe ship by default, and both sit behind interfaces that can be swapped.

2. Quote lifecycle

Figure 1 — A quote is immutable once sent for signature; changes require a new version, which preserves the audit trail.

The pricing engine is a pure function of catalog, quantities, term, and rule version. It has no database access of its own, which makes it directly testable and allows the same code to run in the browser for instant preview and on the server as the authoritative calculation.

3. Components

Catalog	Prisma-modelled products, price books, and term options with effective-dated rows.
Pricing engine	Deterministic, versioned rule evaluation: tiers, volume breaks, ramps, and bundles.
Approval engine	Threshold-driven chains with delegation, timeout escalation, and full decision history.
Renderer	MDX proposal templates compiled to PDF with per-tenant branding and clause blocks.
Signature adapter	DocuSign envelope creation and webhook reconciliation of signer events.
Billing handoff	On countersign, creates the Stripe subscription or invoice schedule from quote lines.

4. Data model highlights

ENTITY	PURPOSE	NOTES
Quote	Header: account, owner, term, rule version, status.	Immutable after send; supersede by version.
QuoteLine	Product, quantity, unit price, discount, ramp schedule.	Carries the applied rule trace.
Approval	One row per decision in the chain.	Append-only; never updated in place.
Envelope	Signature request and signer events.	Reconciled from DocuSign webhooks.

5. Pricing rules

```
export const rules = definePriceBook({
  version: "2026.09",           // quotes pin this value
  currency: "USD",
  tiers: [
    { product: "platform", upTo: 50,   unit: 120 },
    { product: "platform", upTo: 250,  unit: 96  },
    { product: "platform", upTo: null, unit: 78  },   // volume break
  ],
  termMultipliers: { 12: 1.0, 24: 0.92, 36: 0.86 },
  ramp: { allowed: true, maxSteps: 3, minFirstYearPct: 0.4 },
  discountAuthority: { rep: 0.10, manager: 0.20, director: 0.30, vp: 0.45 },
  floors: { platform: 62 },       // hard floor; blocks quote, not just approval
});
```

Listing 1 — Rule books are code-reviewed and versioned; superseded versions stay resolvable forever.

6. Approval chains

- **Routing.** The chain is derived from the deepest discount on any line, not the blended average, which prevents a steep concession on one product from hiding inside an otherwise standard quote.
- **Escalation.** Each step carries a timeout; an unanswered approval escalates to the next level rather than stalling, and every decision records the approver, timestamp, and comment.
- **Hard floors.** Prices below the configured floor cannot be approved by anyone. The quote is blocked at configuration time with the binding line named, so the rep learns before the customer conversation rather than after.

7. Deployment

- Ships as a Next.js application with a Prisma schema and migrations; the reference deployment is a container plus managed Postgres, with object storage for rendered proposals.
- Stripe and DocuSign credentials are the only required secrets. Both adapters are optional at build time — the quote and approval flow runs without them for teams using other providers.
- Webhook endpoints verify provider signatures and are idempotent by event ID, so a replayed signature event cannot create a second subscription.

8. Roadmap

RELEASE	PLANNED WORK	TARGET
1.4	Amendment and co-term quoting against existing subscriptions.	Q4 2026
1.5	Multi-currency price books with period-locked FX.	Q1 2027
2.0	Clause-level redline tracking and a public approval-policy API.	Q2 2027
